

## **UNETsystem & Microsoft Korea Consortium picked out a main performer at KTF Speed Project**

- Standardizes KTF PC environments and implements policy-based integrated management infrastructure
- Uses Anyclick and Microsoft Active Directory for the enterprise user authentication and the standardization

UNETsystem, the leading Network Access Control vendor in Korea, has picked out a main performer with Microsoft Korea at the Speed Project, which is KTF's PC standardization and policy-based integrated management infrastructure implementation.

KTF have used the integrated PC security system for the first time since 2002. As an increasing mobility of user terminals and a spreading mass storage devices are to be new security threats and a wired and a wireless network are merged to the enterprise network, so that KTF selected and push forward with the Speed Project as a core plan of PC security and management innovation.

The main point of Speed Project is that the standardization of user environment in the early stage and the development of the related security features. The purpose is increasing the service satisfaction index of KTF customer through strengthen security of PCs, which can handle their customer's personal data, as preventing service delays and disclosures of customer's private data.

This project starts from strengthen of Digital Right Management functionality, and then puts some milestones such as consolidation & standardization of authentication, firming up of PC security, implementation of central management infrastructure, so that will finish the project until the end of this year.

UNETsystem will implement integrated authentication system for KTF wireless network user, base on their wired/wireless integrated authentication solution Anyclick that is interoperable with Microsoft Active Directory. KTF will develop this authentication system to Network Access Control system for their wired/wireless network users.

Through this project UNETsystem and Microsoft will working together in the spreading of Microsoft Network Access Protection platform and the related business

The CEO of UNETsystem, Jong heon Sim said that, "According to the network and business environment change, enterprise's IT security managers need rearrangement of IT security system and also recognize the importance of its management effectiveness" and also said, "Through the Speed Project, KTF will make PC environment effectively and fortify information security system, so that they can focus on the development for the better quality services
